Research Methodology: Using such scientific method as analysis, the significant principles of theories of international economics were found. Using economic statistical method, the structural changes in GDP economies of individual countries were investigated. Using a systematic approach, the basic aspects of neoclassical theories of international economics were investigated.

Results: The essence of neoclassical theories of international economics and their key aspects of the application in the modern world were identified. The differences in the structure of sectors of developed countries in the context of the time were analyzed.

Novelty: The analysis of methodological problems application of Leontief's concept using data of modern Ukraine and its key trading partners. The possibility of the unified concept of the modern international economy that combines the theory of Leontief and M. Porter was investigated.

The practical significance: Based on the research of methodology of neoclassical theories of international economics the best way to economic research was chosen. Also, a new model that combines the overall concept of Leontief and M. Porter's cluster concept was developed.
