Research Methodology: With help of an integrated approach studied culture occupational health of student as future specialist, which is formed in the process of systematic, targeted education and training on the basis of emotional and value relationship to their own health. Investigated system, “teacher – student”, which is optimal in the development of relations between the subjects of the pedagogical process

Results: The problems of psychological support to ensure occupational health of students by means of physical culture, physical education. Effectiveness in solving this problem is to develop a relationship “teacher–student”. Subjectivity is seen as an important condition for the formation of physical training of students, a healthy lifestyle, value attitude to life, occupational health.

Novelty: For the formation of a professional culture of students (future professionals) introduced a specialized program which is structured by a significant component of the culture of health: cognitive, emotional-evaluative and effective-practical.

The practical significance: Through the implementation of psychological support of subjects of pedagogical process creates favorable prerequisites for the formation of culture of occupational health of future specialists.
